

Shared case and evaluation definition

Reference cow and inventory; fixed nutrient targets
Planned supply; declared composition distribution

Training: freeze one candidate pool Q

Build Q from admissible rations and physical mixtures
Freeze the fixed ration, the selection rules and DM moments

Rules fixed before independent test sampling

Test state from the declared model

Nutrient concentrations θ and actual ingredient DM d

Fixed choice from Q

No nutrient observation
Feed the frozen fixed ration

Fixed as-fed ration

Same q in every test state

Nutrient-informed choice

Observe non-DM nutrients
Choose from Q by the frozen score

Selected as-fed ration

One ration $q(\theta)$ from Q

Actual DM: evaluator only

Common evaluation through the selected NASEM chain

Chosen q with realised nutrients and DM; original domain
Failure = known violation or unresolved verdict

Report per case, dependence structure and training replicate

Failure rates; paired comparisons; descriptive costs
